

Automatic processing of serial numbers

This article describes how number series can be managed automatically using [Nexus GO Cards](#).

Often different types of serial numbers are used in systems or at locations, and they normally contain a prefix (location number/ID) followed by a serial of numbers. Nexus GO Cards includes a key function for automatic management of serial numbers for programmed cards and key fobs. This means that the system can keep track of all number series, eliminating the need to manually administrate number series for different locations. This also removes the risk of the same serial number being produced more than once by mistake.

To set up automatic processing of serial numbers, contact Nexus' customer success team at customersuccess.ds@nexusgroup.com.
