

# Administrator's workbench

The Administrator's workbench (AWB) is used by administration officers in [Nexus Certificate Manager](#) for setting up CA-unique configurations.

For example, these tasks are managed in the AWB:

- Initiate creation of CA keys and CAs
- Implement CA policies, defining how certificates should be issued
- Configure distribution rules for certificates and revocation lists
- Manage officer roles and define officers
- View request log and CIS log

See these articles for more information about AWB.
