Nexus Hybrid Access Gateway

Nexus Hybrid Access Gateway is a software-based authentication and federation product used to enable secure access to digital services – no matter where those services or users are located.

The product supports many user-friendly two-factor authentication (2FA) methods and provides identity federation, enabling users to log on just once (Single-sign on) to reach all managed resources. Hybrid Access Gateway is interoperable with Nexus Personal, services for PKI cards and PKI mobile identity authentication. You can read more in the article Hybrid Access Gateway overview.
