

Nexus GO Discovery

Nexus GO Discovery is a service based on the SAML Identity Provider Discovery specification. The service can be used in a SAML federation to let end users choose what Identity Provider (IdP) to use for login. A Service Provider (SP) that uses this service does not have to implement support for letting users choose authentication method. Nexus GO Discovery follows the specification for SAML IdP Discovery service from Oasis.

When you order Nexus GO Discovery, you get your own service web page that can be branded to fit your needs. Alternatively, you can connect to the service via the [Nexus GO Discovery API](#).

How does it work?

Discovery step-by-step

1. The user visits the service provider web application, clicks log in and is redirected to Nexus GO Discovery.
2. Nexus GO Discovery presents all available authentication methods (identity providers) in a list.
3. The user selects a method and is redirected to the service provider. The service provider gets information of the choice of identity provider.

4. The service provider redirects the user to the identity provider of the selected authentication method.
5. The user logs in with the requested method, and is redirected back to the service provider.
6. The user is logged in.
